EDUCATION

- **Namık Kemal High School**
Math and science department
Completed in September 2019
- **Eastern Mediterranean University**
Bachelor of software engineering
Completed in March 2024
- **Technical University of Munich**
Master of Information Engineering
2024 - in progress

SKILLS

- Full-Stack Software Development
- Artificial Intelligence Integration
- AI Agent Development
- MCP Integration for AI Tools
- Cyber Security
- Database Management

NATIONALITY

Cypriot (Zypriot) 🇨🇵

LANGUAGES

English (Advance)
Turkish (Native Language)

Hüseyin Soykök

Software Engineer

ABOUT ME

A dynamic and highly driven engineer that is dedicated to further extending my knowledge of software and hardware technologies. I actively participate in group work to guarantee comprehensive investigation of concepts and am committed to completing assigned duties with the utmost efficiency.

As a determined and diligent engineer, I am constant in the achievement of my goals. I have been consistent in my commitment to learning a varied range of expertise throughout my graduate study and profession. My previous experience includes working as a software engineer, contributing to both individual projects and partnering with a number of prestigious corporations and financial institutions.

As a software engineer, I have always prioritized artificial intelligence since I understand how important it is in today's technology world. This devotion involves a never-ending drive for self-improvement in this critical domain. Looking ahead, my motivation inspires me to expand my expertise of software engineering in order to contribute to the latest developments in artificial intelligence, cyber security, software development and related fields.

AWARDS & CERTIFICATES

- Best Project Award 2023-2024 (Sponsorship Program Web Application for Orphan or Poor Family Children)
- Software Genius Programme Completing Award (Creditwest Bank)
- Artificial Intelligence Summit Participation Certificate - AI SUMMIT 2024

WORK EXPERIENCE

Creditwest Bank | Internship 07/2021-08/2021

I participated in the Software Genius program at Creditwest Bank and worked as an intern software engineer. I worked in various jobs during my tenure (system installation in bank branches, troubleshooting malfunctions in branches). I also worked as a backend developer on the QR code-based entry and exit system for bank personnel using ASP.NET.

Cyprus Luxury Taxi | Full Stack Developer 09/2022-05/2023

As a full-stack developer, I spearheaded the end-to-end execution of the Cyprus Luxury Taxi Company project, seamlessly blending front-end design, back-end coding(Node.js and Type Script), database architecture, and marketing efforts. The project, aimed at boosting employment in the tourism sector, was not only managed but also delivered successfully. Today, Cyprus Luxury Taxi Company thrives as a testament to its ongoing success.

WORK EXPERIENCE

Aqua Tour Trave Agency | Full Stack Developer

04/2023-09/2023

As a solo full-stack developer, I orchestrated the comprehensive development of the Aqua Tour Travel Agency project. From front-end design to back-end coding(Node.js and Type Script), database architecture, and marketing strategies, I successfully navigated every aspect. The project, dedicated to enhancing tourism, stands as Aqua Tour Travel Agency, actively flourishing under my management.

Cyprus Taxi Now Company | Full Stack Developer

10/2023-12/2023

In my role as a full-stack developer, I single-handedly drove the development of the Cyprus Taxi Now Company project. I seamlessly handled front-end design, back-end coding(Node.js and Type Script), database design, and marketing. The project, aimed at optimizing taxi services, was not only successfully managed but also delivered with excellence. Today, Cyprus Taxi Now Company stands as a thriving entity in the transportation sector, a testament to its ongoing success.

Nucleus Software | Full Stack Developer

06/2023-08/2023

As a Full Stack Junior Developer at Nucleus Software, I am working a pivotal role in overseeing comprehensive project development. My responsibilities span from front-end design and back-end coding to database architecture. I successfully navigated diverse tasks to ensure the seamless integration of projects, contributing significantly to Nucleus Software's success in the technology landscape.

PROJECTS

Eastern Mediterranean University | Blockchain Systems

11/2021-01/2022

In the project's design, we implemented the Merkle Tree method for blockchain verification and encryption, alongside RSA encryption for securing private and public keys. To enhance security, a straightforward verification algorithm was developed to validate whether the entered private key corresponds to the provided public key. As a result, the project ensures a secure and decentralized shopping experience for users, allowing them to shop in a confidential environment without tracking.

Eastern Mediterranean University | Pharmacy Information System (PSI)

11/2022-01/2023

This project focuses on simulating pharmacy information and stock status, addressing the needs of pharmacists. The primary objective is to develop a new pharmacy information system based on feedback from pharmacists, addressing their specific challenges. The project employs fundamental website programming languages, including HTML, CSS, and Javascript, to create an effective and user-friendly system that caters to the unique requirements of pharmacy management.

Eastern Mediterranean University | Vehicle Motion Control (VMC) Real-Time System Project

10/2023-01/2024

This project utilizes Python to create a vehicle simulation program with a user interface (GUI) for real-time plotting. Users can specify virtual vehicle characteristics, control simulation parameters, and observe the vehicle's behavior over time. The combination of these methods aims to enhance user understanding and decision-making in the simulation environment.

Eastern Mediterranean University | Incubaby (IB01) Design of Controller For a Premature Infant

11/2023-02/2024

The INCUBABY (IB01) project designs a control system to support the healthy development of premature babies. In this project, a control and monitoring system of a baby incubator will be developed using Node-RED, Scilab and Proteus. This project effectively uses modern technology with the aim of improving the living conditions of premature babies.

Eastern Mediterranean University | Sponsorship and Donation Web Application

03/2023-01/2024

This project is dedicated to creating a system that aids and provides donations for underprivileged children, specifically those who are orphaned or in need due to various circumstances. The implementation utilizes Node.js and follows the EJS format for dynamic web pages. PostgreSQL is employed for efficient database operations, ensuring the smooth functioning of the system in managing and facilitating assistance for children in need.

PROJECTS

Technical University of Munich | Hospital Optimization Competition

03/2025–08/2025

This project implements an advanced hospital optimization system for the Business Process Optimization Competition 2025. The solution provides intelligent planning and scheduling mechanisms that minimize both operational costs and patient treatment cycle times through sophisticated algorithms including Genetic Algorithm (GA) and Simulated Annealing (SA).

Technical University of Munich | Generative AI – AI Integrated Facility Booking System

02/2025–07/2025

Developed a smart web application for intelligent room search, booking, and facility availability management across campus environments. The system integrates natural language processing capabilities using Gemini AI, enabling users to perform semantic queries and receive context-aware results. Built a full-stack solution with a focus on scalable architecture and responsive user experience, and deployed the application on DigitalOcean infrastructure for reliable cloud hosting. The project combines traditional reservation system functionality with AI-driven enhancements, improving usability and efficiency in resource management.

Technical University of Munich | Modern Desktop Application for Analyzing New York City Airbnb Data

10/2025–02/2026

Developed a professional desktop analytics application in Python (PySide6/Qt6) for multi-perspective exploration of 48,895 NYC Airbnb listings. Engineered five role-specific dashboards. Traveler, Investor, Regulator, Competitor, and Journalist each with tailored interactive Plotly visualizations rendered via WebEngine. Refactored from a Dash prototype to a modular Qt architecture achieving 3–6× performance improvements. Applied PEP 8, type hints, docstrings, and pytest-based testing throughout.

Technical University of Munich | Future Computing Laboratory – Neuromorphic Computing (SpiNNaker2 / NeuroFEM)

10/2025–02/2026

Implemented a NeuroFEM-based neuromorphic solver on SpiNNaker2 (SpiNNcloud) in parallel collaboration with **HLRS Stuttgart** to solve discretized PDEs $Ax=b$ using massively parallel PI-controller dynamics, performing parameter sweeps ($y, \Delta t, NPM$) to minimize solution error under strict per-core memory constraints.

Technical University of Munich | AI Coding: Modern Software Development

02/2026–07/2026

AI-Powered SAP Custom Code Analyzer is a **TUM–Deloitte** project focused on building reusable Claude Code skills and agents to automatically analyze SAP ECC custom ABAP code for S/4HANA Brownfield conversion readiness. The project detects obsolete tables, deprecated function modules, and incompatible ABAP patterns, then recommends S/4HANA-compliant remediation and code adaptations.
